

SAMPLE BOOK

This is a sample book generated using my open source "Book" Java CLI tool. The tool uses the famous iText library to generate really efficient, clean and compliant PDFs. This includes generating the book title as well as automatic page numbers for the rest of the book. While you can have new spaces in your source files and this is entirely up to you, keep in mind that the final rendered book strips out all new lines. This style which I call "Anharian" is very very minimal on purpose. The purpose is to focus purely the content, and remove everything else that is basically "fluff", this means we don't bother with things like index, chapters, and prologue etc. It may not be to everyone's taste, and that's fine, but for those who are minimalists, I believe they will appreciate the totally stripped down format, and one that enhances the "signal to noise" ratio! Given this tool is just a fat "jar", other than having JVM installed on your Operating System, how you manage your book workflow is entirely up to you. For example I just use a 3 window workflow, one is the rendered PDF, one is VIM where I edit each file, and the final window is the shell where I execute the Book CLI to re-generate the PDF. All your source files are just written in plain text files i.e "txt" files, however the file name has to follow a strict pattern that starts at "000.txt" and then can go all the way up to a maximum of "999.txt". The very first file that

is "000.txt" can only contain the title of your book, and then every other file afterwards just contains your book content. The "Anharian" format does not allow anything else, no diagrams, images, tables, nothing! Just a stream of raw text. For me this style was heavily inspired by the old ASCII files I used to read back in the early 90s. But this style is even more restrictive as we don't preserve the spacing (which is needed for ASCII art). Perhaps I may add an option to preserve spaces for those that would like to include some kind of ASCII art or similar formatting. For now at least this is not an option. "Book" renders to the standard "B" format size, that is 129mm wide and 198mm in height or 5.08 Inches by 7.8 Inches. If you don't like this specific size, just change the source code for "Book" and re-compile it to build your own customised version, you will need to use the Java "Grind" build tool that is also available on my GitHub as another open source project. For me this totally distraction free and single tool method feels like it has removed every single thing that stops me from pouring my ideas and thoughts down. VIM opens instantly and I'm not fighting the tools, they work for me and not the other way around. This speed allows me to focus on the content, because in the end that's all that matters!
